## 2.4G FSK/GFSK Приемопередатчик

### 1. Общее описание

A7105 - это высокопроизводительный и недорогой беспроводной приемопередатчик диапазона ISM 2,4 ГГц. Это устройство объединяет в себе как высокочувствительный приемник (-95дБм при 500 Кбит/с), так и высокоэффективный усилитель мощности (до 1 дБм). При низкой скорости передачи данных A7105 обладает особой устойчивостью на дальнем расстоянии прямой видимости из-за своей сверхвысокой чувствительности (-107дБм при 2 Кбит/с, -104дБм при 25 Кбит/с) без необходимости внешней LNA или PA. Регистр скорости передачи данных (0x0E) позволяет пользователю настроить скорость передачи данных от 2 Кбит/с до 500 Кбит/с.

A7105 имеет быстрое время настройки (130 мкс) для систем скачкообразной перестройки частоты. Для обработки пакетов A7105 имеет встроенный разделенный 64-байтовый TX/RX FIFO (может быть расширен до 256 байт) для буферизации данных и пакетной передачи, CRC для обнаружения ошибок, FEC для 1-битной коррекции данных на кодовое слово, RSSI для оценки качества канала, отсеивание данных для шифрования / дешифрования данных. Эти функции очень просты в использовании при разработке беспроводной системы. Все функции интегрированы в небольшой чип QFN 4X4 20 контактов.

К управляющим регистрам A7105 можно легко получить доступ через 3-проводную или 4-проводную шину SPI. Для экономии энергии A7105 поддерживает спящий режим, режим ожидания. Для удобства использования A7105 имеет уникальный набор команд SPI под названием Strobe commAnd, которые используются для управления. Основываясь на стробоскопических командах через шину SPI, MCU может управлять всем: от энергосбережения, отправки TX, приема RX, мониторинга каналов, скачкообразной перестройки частоты до автоматической калибровки. Кроме того, A7105 поддерживает две линии ввода-вывода общего назначения, GIO1 и GIO2, чтобы сообщить MCU его статус, чтобы MCU мог использовать либо опрос, либо схему прерывания для выполнения радиопереправления. Следовательно, очень легко контролировать радиопередачу между MCU и A7105 из-за его цифрового интерфейса.

### 9. Управляющие регистры

A7105 содержит 51 x 8-бит управляющий регистр. MCU может получить доступ к этим управляющим регистрам через 3-проводный (SCS, SCK, SDIO) или 4-проводный (SCS, SCK, SDIO, GIO1/GIO2) SPI-интерфейс (поддержка макс. скорость передачи данных SPI до 10 Мбит/с). Пользователь может обратиться к главе 10 для получения подробной информации о временных задержках SPI. A7105 управляется просто регистрами и выводит свое состояние на микроконтроллер выводами GIO1 и GIO2.

## 10. SPI

A7105 only supports one SPI interface with mAXimum data rate up to 10Mbps. MCU should assert SCS pin low (SPI chip select) to active accessing of A7105. Via SPI interface, user can access **control registers** and issue **Strobe commAnd**. Figure 10.1 gives an overview of SPI access mAnners.

3-wire SPI (SCS, SCK and SDIO) or 4-wire SPI (SCS, SCK, SDIO and GIO1/GIO2) configuration is provided. For 3-wire SPI, SDIO pin is configured as bi-direction to be data input and output. For 4-wire SPI, SDIO pin is data input and GIO1 (or GIO2) pin is data output. In such case, GIO1S (0bh) or GIO2S (0ch) should be set to [0110].

For SPI write operation, SDIO pin is latched into A7105 at the rising edge of SCK. For SPI read operation, if input address is latched by A7105, data output is aligned at falling edge of SCK. Therefore, MCU can latch data output at the rising edge of SCK.

To control A7105's internal state mACHine, it is very easy to send Strobe commAnd via SPI interface. The Strobe commAnd is a unique commAnd set with total 8 commAnds. See section 10.3, 10.4 and 10.5 for details.

4-Wire SPI	SCS pin = 0	SDIO pin	GIO1 (GIO1S=0110) / GIO2 (GIO2S=0110)

### 10.2 Временные характеристики SPI

Независимо от того, настроен ли 3-проводной или 4-проводной интерфейс SPI, максимальная скорость передачи данных SPI составляет 10 Мбит/с. Для активации интерфейса SPI вывод CS должен быть установлен в низкий уровень. Для правильной фиксации данных пользователь должен позаботиться о времени удержания и времени настройки между SCK и SDIO. См. Таблицу 10.2 Временные характеристики SPI.

## 10.3 Команда сброса

В дополнение к сбросу питания (POR) MCU может выполнить программный сброс A7105, установив регистр (00h) через интерфейс SPI, как показано ниже. До тех пор, пока 8-битный адрес (A7~A0) равен нулю, и данные (D7~D0) равны нулю, A7105 получает информацию для генерации внутреннего сигнала “RESETN” для инициализации самого себя. После команды сброса A7105 находится в режиме ожидания (standby mode), и процедура калибровки должна быть выполнена снова.

## 2.4G FSK/GFSK Приемопередатчик

### 10.4 Команды доступа к ID

A7105 имеет встроенный 32-битный идентификационный регистр для индивидуального идентификатора. Доступ к нему осуществляется через интерфейс SPI. Длину идентификатора рекомендуется оставлять 32 бита, установив IDL (регистр 1Fh). Пользователь может переключить вывод SCS на высокий, чтобы завершить команду доступа к ID, когда данные ID полностью переданы.

На рис.10.13 и 10.14 представлены временные диаграммы обращения к 32-битному ID через 3-проводный SPI.

#### 10.4.1 Команда записи ID

Пользователь может подробно ознакомиться с временной диаграммой записи SPI на рис.10.2. Ниже приведена процедура выполнения команды записи ID.

- Шаг 1: Передайте A7~A0 = 00000110 (A6=0 для записи, A5~A0 = 000110 регистр ID DATA, 06h).
- Шаг 2: Через вывод SDIO передайте 32-битный идентификатор в A7105 в последовательности байтов данных 0 (рекомендуется 5xh или Axh), 1, 2 и 3.
- Шаг 3: Переключите вывод SCS на высокий уровень, когда шаг 2 будет завершен.

### 10.5 FIFO Accessing CommAnd

To use A7105's FIFO mode, enable FMS (01h) =1 via SPI interface. Before TX delivery, just write wanted data into TX FIFO (05h) then issue TX Strobe commAnd. Similarly, user can read RX FIFO (05h) once payload data is received.

MCU can use polling or interrupt scheme to do FIFO accessing. FIFO status can output to GIO1 (or GIO2) pin by setting GIO1S (0Bh) or GIO2S (0Ch).

Figure 10.15 and 10.16 are timing charts of FIFO accessing via 3-wire SPI.

#### 10.5.1 TX FIFO Write CommAnd

User can refer to Figure 10.2 for SPI write timing chart in details. Below is the procedure of TX FIFO write commAnd.

- Step1: Deliver A7~A0 = 00000101 (A6=0 for write control register and issue FIFO A [5:0] = 05h).
- Step2: By SDIO pin, deliver (n+1) bytes TX data into TX FIFO in sequence by Data Byte 0, 1, 2 to n.
- Step3: Toggle SCS pin to high when step2 is completed.
- Step4: Send Strobe commAnd of TX mode (Figure 10.9) to do TX delivery.

Figure 10.15 TX FIFO Write CommAnd Timing Chart

#### 10.5.2 Rx FIFO Read CommAnd

User can refer to Figure 10.2 for SPI read timing chart in details. Below is the procedure of RX FIFO read commAnd.

- Step1: Deliver A7~A0 = 01000101 (A6=1 for read control register and issue FIFO at address 05h).
- Step2: SDIO pin outputs RX data from RX FIFO in sequence by Data Byte 0, 1, 2 to n.
- Step3: Toggle SCS pin to high when RX FIFO is read completely.

### 11. State mACHine

In chapter 9 and chapter 10, user can not only learn A7105's control registers but also know how to issue Strobe commAnd. From section 10.2 ~ 10.6, it is clear to know configurations of 3-wire SPI and 4-wire SPI, Strobe commAnd, software reset, and how to access ID Registers as well as TX/RX FIFO.

Section 11.1 introduces 7 states of built-in state mACHine. Combined with Strobe commAnd and accessing control registers, section 11.2, 11.3 and 11.4 demonstrate 3 state diagrams to explain how transitions of A7105's operation.

From accessing data point of view, if FMS=1 (01h), FIFO mode is enabled, otherwise, A7105 is in direct mode. If FMS=1 and FIFO Read/Write in Standby mode, we call it NormAI FIFO mode. Otherwise, If FMS=1 and FIFO Read/Write in PLL mode, we called it Quick FIFO mode due to the time reduction of PLL settling. If FMS=1 and FIFO Read/Write in IDLE mode, we called it Power Saving FIFO mode due to the reduction of average current.

- (3) Idle mode
- (4) PLL mode
- (5) TX mode
- (6) RX mode
- (7) CAL mode

After power on reset or software reset, A7105 is in standby mode. User has to do calibration process because all control registers are in initial values. The calibration process is very easy, user only needs to issue Strobe commAnds and enable calibration registers. Then, check the calibration flag because it is done automAtic by internal state mACHine. Refer to 11.2, 11.3, 11.4 and chapter 15 for details. After calibration, A7105 is ready to do TX and RX operation.

##### 11.1.1 Standby mode

## 2.4G FSK/GFSK Приемопередатчик

- (1) In FIFO mode, once RX data packet (Preamble + ID + Payload) is received completely, A7105 supports auto-back function to previous state for next receiving packet.

### 11.5 Quick Direct Mode

This mode is suitable for fast transceiving. After calibration flow, for every state transition, user has to issue Strobe command to A7105. This mode is also suitable for the requirement of versatile packet format. Noted that user needs to take care the transition time by MCU's timer.

When packets are finished and deeper power saving is necessary, user can issue Strobe command to ask A7105 staying in idle mode (or sleep mode). Figure 11.3 is the state diagram of Quick Direct mode.

- See Table 11.12 (next page) for RX-PRDY..
- From PLL to WPLL, it is either 70 us (LO frequency changed) or 10 us (LO frequency NOT changed)

## 2.4G FSK/GFSK Приемопередатчик

From Figure 11.10, After A7105 enters TX mode, MCU should immediately deliver preamble. Therefore, user can send dummy preamble since WTR goes high or plus a delay loop to make sure dummy preamble is 10 bits at least before DCK is active. See below figure for detail timing.

From Figure 11.10, in RX mode, A7105 will check received ID compared to ID register (06h). If ID is matched, FSYNC will be output. MCU can decode received ID and payload from GIO1 pin (TRXD) via rising edge of RCK (recovery clock). Then, GIO2 pin can be used to inform MCU reference timing by PMDO (Preamble Detect Output) or FSYNC (Frame Sync).

## 12 Crystal Oscillator

A7105 needs external crystal or external clock that is either 6 or 8/12/16/20/24 МГц to generate internal wanted clock. Be noted if external clock is equal or lower than 8MHz, A7105 only supports data rate up to 250K.

### 12.1 Use External Crystal

Figure 12.1 shows the connection of crystal network between XI and XO pins. C1 and C2 capacitance are used to adjust different crystal loading. A7105 supports crystal accuracy within  $\pm 20$  ppm under firmware frequency compensation. Be noted that crystal accuracy requirement includes initial tolerance, temperature drift, aging and crystal loading.

Firmware FC = Off	$\pm 10$ ppm	$\leq 80$ ohm

Fig12.1 Crystal oscillator circuit, refer to A7105 App. Note for C1 and C2.

### 12.2 Use external clock

A7105 has built-in AC couple capacitor to support external clock input. Figure 12.2 shows how to connect. In such case, XI pin is left opened. XS shall be low (0Dh) for selecting external clock. The frequency accuracy of external clock shall be controlled within  $\pm 20$  ppm, and the amplitude of external clock shall be within 1.2 ~ 1.8 V peak-to-peak.

Fig12.2 External clock source. R is used to tune  $V_{pp} = 1.2 \sim 1.8V$

### 13. System Clock

A7105 supports different crystal frequency by programmable "Clock Register" (0Dh). Based on this, three important internal clocks  $F_{CGR}$ ,  $F_{DR}$  and  $F_{SYCK}$  are generated.

- (1)  $F_{XTAL}$ : Crystal frequency.
- (2)  $F_{XREF}$ : Crystal Ref. Clock =  $F_{XTAL} * (DBL+1)$ .
- (3)  $F_{CGR}$ : Clock Generation Reference =  $2M\Gamma\text{ц} = F_{XREF} / (GRC+1)$ , where  $F_{CGR}$  is used to generate 32M PLL.
- (4)  $F_{MCLK}$ : Master Clock is either  $F_{XREF}$ : or 32M PLL, where  $F_{MCLK}$  is used to generate  $F_{SYCK}$ .
- (5)  $F_{SYCK}$ : System Clock =  $16MHz = F_{MCLK} / CSC = 32 * F_{IF}$ , where  $F_{IF}$  is recommended to set  $500K\Gamma\text{ц}$ .
- (6)  $F_{DR}$ : Data Rate Clock =  $F_{IF} / (SDR+1)$ .
- (7)  $F_{FPD}$ : VCO Compared Clock =  $F_{XREF} / (RRC+1)$ .

$$F_{PFD} = F_{XREF} / (RRC [1:0]+1)$$

$$F_{DR} = F_{XREF} / (CSC [1:0]+1) / 32 / (SDR+1)$$

### 13.2 Enable clock generation

If crystal frequency is the multiplier of 2МГц and larger than 6MHz, set CGS = 1 to enable  $F_{SYCK} = 32\text{МГц}$  (internal 32МГц PLL). The comparison frequency of clock generator  $F_{CGR}$  shall be 2МГц by setting GRC[3:0] to meets the below equations.

$$F_{CRG} = F_{XTAL} * (1 + DBL) / (GRC + 1) = 2\text{MHz.}$$

$$F_{DR} = F_{SYCK} / 32 / (SDR + 1).$$

## 14. Transceiver LO Frequency

A7105 is a half-duplex transceiver with embedded PA and LNA. For TX or RX frequency setting, user just needs to set up LO (Local Oscillator) frequency for two ways radio transmission.

To target full range of 2.4ГГц ISM band (2400 МГц to 2483.5 MHz), A7105 applies offset concept by LO frequency  $F_{LO} = F_{LO\_BASE} + F_{OFFSET}$ . Therefore, this device is easy to implement frequency hopping and multi-channels by just **ONE** register setting, **PLL Register I (CHN [7:0], 0Eh)**.

Below is the LO frequency block diagram.

### 14.1 LO Frequency Setting

From Figure 14.1,  $F_{LO}$  is not only for TX radio frequency but also to be RX LO frequency. To set up  $F_{LO}$ , it is easy to implement by below 4 steps.

- Set the base frequency ( $F_{LO\_BASE}$ ) by PLL Register II, III, IV and V (10h, 11h, 12h and 13h).  
**Recommend to set  $F_{LO\_BASE} \sim 2400.001\text{MHz}$ .**
- Set the channel step ( $F_{CHSP}$ ) by PLL Register II (10h).  
 **$F_{CHSP} = F_{XTAL} \cdot (DBL+1) / 4 / (CHR+1)$ , Recommend  $F_{CHSP} = 500\text{KHz}$ .**
- Set CHN [7:0] to get offset frequency by PLL Register I (0Fh).  
 **$F_{OFFSET} = CHN[7:0] \times F_{CHSP}$**
- LO frequency is equal to base frequency plus offset frequency.  
 **$F_{LO} = F_{LO\_BASE} + F_{OFFSET}$**

$F_{LO\_BASE}$

$$F_{LO\_BASE} = F_{PFD} \cdot (BIP[8:0] + \frac{BFP[15:0]}{2^{16}}) = (DBL + 1) \cdot \frac{F_{XTAL}}{RRC[1:0] + 1} \cdot (BIP[8:0] + \frac{BFP[15:0]}{2^{16}})$$

Base on the above formula, for example, if  $F_{XTAL} = 16\text{MHz}$  and set channel step  $F_{CHSP} = 500\text{KHz}$ , to get  $F_{LO\_BASE}$  and  $F_{LO}$ , see Table 14.1, 14.2, and Figure 14.2 for details.

## 14.2 IF Side Band Select

In two ways radio, both mASter and slave have two roles, TX and RX. In general, slave usually has to reply an ACK-packet or status update. In such case, A7105 offers two methods to set up  $F_{LO}$  while TRX exchanging.

- (1) Auto IF exchange
- (2) Fast exchange

### 14.2.1 Auto IF Exchange

A7105 supports Auto IF offset function (AIF, 01h). If AIF is enabled, only one on-air occupied frequency ( $F_{\text{carrier}}$ ). In this case, user has no need to change  $F_{\text{RXLO}}$  while TRX exchanging because  $F_{\text{RXLO}}$  is auto shifted  $F_{\text{IF}}$ . See below Figures and Table 14.4 for details.

#### <MAster>

AIF=1 and ULS=0,  $F_{\text{RXLO}}$  is auto shifted lower than  $F_{\text{TXLO}}$  for 500KГц ( $F_{\text{IF}}$ ).

#### <Slave>

### 14.2.2 Fast Exchange

To reduce PLL settling time, user can disable AIF function. If AIF is disabled, two On-air frequency ( $F_{Carrier(Master)}$ ,  $F_{Carrier(slave)}$ ) are occupied. In this case, user has to control  $ULS=0$  (MAster side) and  $ULS=1$  (Slave side) for fast exchange in two-way radio. See below Figures and Table 14.5 for details.

#### <MAster>

AIF=0 and ULS=0, MAster is set Up side band.

#### <Slave>

AIF=0 and ULS=1, Slave is set Low side band.

## 2.4G FSK/GFSK Transceiver

Frequency Compensation function (FC) supports low accuracy crystal ( $\pm 20$  ppm) without sensitivity degradation. The FC concept is to fine tune RX LO frequency ( $F_{RXLO}$ ). MCU can read AC[14:0], (12h) and (13h), to executes frequency drift calculation and update new setting to PLL IV (12h) and PLL V (13h) to adjust the best RX LO frequency ( $F_{RXLO}$ ).

## 16. FIFO (First In First Out)

A7105 supports separated 64-bytes TX and RX FIFO by enabling FMS =1 (01h). For FIFO accessing, TX FIFO (write-only) and RX FIFO (read-only) share the same register address 05h. TX FIFO represents transmitted payload. On the other hand, once RX circuitry synchronizes ID Code, received payload is stored into RX FIFO.

In chapter 10 and 11, user can also find listed FIFO information below.

- (1) Figure 10.15 and 10.16 for FIFO accessing via 3-wire SPI.
- (2) Section 10.4.7 and 10.4.8 for FIFO pointer reset command.
- (3) Figure 11.2 and Figure 11.3 for Normal/Quick FIFO mode.

### 16.1 Packet Format

Figure 16.1 Packet Format of FIFO mode

Figure 16.2 ID Code Format

#### Preamble:

The packet is led by preamble composed of alternate 0 and 1. If the first bit of ID code is 0, preamble shall be 0101...0101. In the contrast, if the first bit of ID code is 1, preamble shall be 1010...1010. Preamble length is recommended to set 4 bytes by PML [1:0] (1Fh).

#### ID code:

ID code is recommended to set 4 bytes by IDL=1 (1Fh). ID Code is sequenced by Byte 0, 1, 2 and 3 (Recommend to set ID Byte 0 = 5xh or Axh). If RX circuitry checks the ID code correct, received payload will be stored into RX FIFO. In special case, ID code could be set error tolerance (0~ 3bit error) by ETH [1:0] (20h) for ID synchronization check.

#### Payload:

Payload length is programmable by FEP [7:0] (03h) from 1 byte to 64 bytes. The physical FIFO depth is 64 bytes. A7105 also supports logical FIFO extension up to 256 bytes. See section 16.4.3 for details.

#### CRC (option):

In FIFO mode, if CRC is enabled (CRCS=1, 1Fh), 2-bytes of CRC value is transmitted automatically after payload. In the same way, RX circuitry will check CRC value and show the result to CRC Flag (00h).

### 16.2 Bit Stream Process

A7105 supports 3 optional bit stream process for payload, they are,

- (1) CCITT-16 CRC ( $x^{16} + x^{15} + x^2 + 1$ )
- (2) (7, 4) Hamming FEC
- (3) Data Whitening by XOR PN7 (7-bits Pseudo Random Sequence).

#### CRC (Cyclic Redundancy Check):

1. CRC is enabled by CRCS= 1 (1Fh). TX circuitry calculates the CRC value of payload (preamble, ID code excluded) and transmits 2-bytes CRC value after payload.
2. RX circuitry checks CRC value and shows the result to CRC Flag (00h). If CRCF=0, received payload is correct, else error occurred. (CRCF is read only, it is revised internally while receiving every packet.)

#### FEC (Forward Error Correction):

1. FEC is enabled by FECS= 1 (1Fh). Payload and CRC value (if CRCS=1) are encoded by (7, 4) Hamming code.
2. Each 4-bits (nibble) of payload is encoded into 7-bits code word as well as delivered out automatically.  
**(ex. 64 bytes payload will be encoded to 128 code words, each code word is 7 bits.)**
3. RX circuitry decodes received code words automatically. FEC supports 1-bit error correction each code word. Once 1-bit error occurred, FEC flag=1 (00h). (FECF is read only, it is revised internally while receiving every packet.)

#### Data Whitening:

1. Data whitening is enabled by WHTS= 1 (1Fh). The initial seed of PN7 is WS [6:0] (21h). Payload is always encrypted by bit XOR operation with PN7. CRC and/or FEC are also encrypted if CRCS=1 and/or if FECS=1.
2. RX circuitry decrypts received payload and 2-bytes CRC (if CRCS=1) automatically. Be notice, user shall set the same WS [6:0] (21h) to TX and RX.

### 16.4.1 Easy FIFO

In Easy FIFO, mAx FIFO length is 64 bytes. FIFO length is equal to **(FEP [7:0] +1)**. User just needs to control FEP [7:0] (03h) and disable PSA and FPM as shown below.

### 16.4.2 Segment FIFO

## 2.4G FSK/GFSK Transceiver

In Segment FIFO, TX FIFO length is equal to (FEP [7:0] – PSA [5:0] + 1). FPM [1:0] should be zero. This function is very useful for button applications. In such case, each button is used to transmit fixed code (data) every time. During initialization, each fixed code is written into corresponding segment FIFO once and for all. Then, if button is triggered, MCU just assigns corresponding segment FIFO (PSA [5:0] and FEP [7:0]) and issues TX strobe commAnd.

If TX FIFO is arranged into 8 segments, each TX segment and RX FIFO length are 8 bytes

TX				Control Registers

### 16.4.3 FIFO Extension

In FIFO Extension, payload is programmable up to 256 bytes. In this mode, SPI data rate is important to prevent error operation of FIFO extension. Therefore, MCU's SPI data rate shall be **faster than A105 on-air data rate**. Then, FPM [1:0] is used to set FIFO Pointer Flag (FPF) to inform MCU correct timing to write TX-FIFO or read RX-FIFO. FIFO pointer Flag (FPF) is output to pin CKO by set CKOS = [0010] (0AH).

#### Procedures of TX FIFO Extension

### 17.1 RSSI Measurement

A7105 supports 8-bits digital RSSI to detect RF signal strength. RSSI value is stored in ADC [7:0] (1Dh). Fig 17.1 shows a typical plot of RSSI reading as a function of input power. This curve is base on the current gain setting of A7105 reference code. A7105 automatically averages 8-times ADC conversion a RSSI measurement until A7105 exits RX mode. Therefore, each RSSI measuring time is ( 8 x 20 x  $F_{ADC}$ ). For quick RSSI measurement, recommend to set FSARS = 1 ( $F_{ADC}$  = 8MHz, 20 us measuring time). For power saving, recommend to set FSARS = 0 ( $F_{ADC}$  = 4MHz, 40 us measuring time). Be aware RSSI accuracy is about  $\pm 6$ dBm.

Figure 17.1 Typical RSSI characteristic.

#### Auto RSSI measurement for TX Power:

1. Set wanted  $F_{RXLO}$  (Refer to chapter 14).
2. Set RSS= 1 (1Eh), FSARS= 0 (1Eh, 4MHz ADC clock).
3. Enable ARSSI= 1 (01h).
4. Send RX Strobe command.
5. In RX mode, 8-times average a RSSI measurement periodically.
6. Exit RX mode, user can read digital RSSI value from ADC [7:0] (1Dh) for TX power.

In step 6, if A7105 is set in direct mode, MCU shall let A7105 exit RX mode within 40 us to prevent RSSI inaccuracy.

#### Auto RSSI measurement for Background Power:

1. Set wanted  $F_{RXLO}$  (Refer to chapter 14).

3. Enable ARSSI= 1 (01h).
4. Send RX Strobe commAnd.
5. MCU delays min. 140us.
6. Read digital RSSI value from ADC [7:0] (1Dh) to get background power.
7. Send other Strobe commAnd to let A7105 exit RX mode.

### 17.2 Carrier Detect

Base on RSSI measurement, user can extend its application to do carrier detect (CD). In Carrier Detect mode, RSSI is refresh every 5 us without 8-times average. If RSSI level is below threshold level (RTH), CD is output high to GIO1 or GIO2 pin to inform MCU that current channel is busy.

Below is a reference procedure:

1. Set RTH (1Dh) for absolute RSSI threshold level (ex. RTH = 80d).
2. Set GIO2S = [0010] (0Ch) for Carrier Detect to GIO2 pin.
  - (2-1) Set wanted  $F_{RXLO}$  (Refer to chapter 14).
  - (2-2) Set RSS= 1 (1Eh), FSARS= 0 (1Eh, 4MHz ADC clock), RSM= [11] (1Eh, hysteresis, 20d).
  - (2-3) Enable ARSSI= 1 (01h).
  - (2-4) Send RX Strobe commAnd.
  - (2-5) MCU enables a timer delay (min. 100 us).
3. MCU checks GIO2 pin.
  - (3-1) If  $ADC \geq (RTH + RSM)$ , GIO2 = 0.
  - (3-2) If  $ADC \leq (RTH)$ , GIO2 = 1.
  - (3-3) If ADC locates in hysteresis zone, GIO2 = previous state.
4. Exit RX mode.

## 18. Battery Detect

A7105 has a built-in battery detector to check supply voltage (REG1 pin). The detecting range is 2.0V ~ 2.7V in 8 levels.

### Relative Control Register

Battery detect Register (Address: 27h)

Name	R/W	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0

[100]: 2.4V. [101]: 2.5V. [110]: 2.6V. [111]: 2.7V.

Below is the procedure to detect low voltage input (ex. below 2.1V):

1. Set A7105 in standby or PLL mode.
2. Set BVT (27h) = [001] and enable BDS (27h) = 1.
3. After 5 us, BDS is auto clear.
4. MCU reads BDF (27h).  
 If REG1 pin > 2.1V,  
 BDF = 1 (battery high). Else, BDF = 0 (battery low).

## 19 TX power setting

A7105 supports programmable TX power from – 20dBm~ 1 dBm by TX test register (28h). User can configure PAC[1:0] and TBG[2:0] for different TX power level. The following tables show the typical TX power vs. current in different settings..

For PAC = 3:

TBG	0	1	2	3	4	5	6	7
TX output (dBm)	-17.6	-14.5	-10	-7.2	-5.1	-3.5	-0.5	1.3
Current (mA)	17.6	17.7	17.78	18.1	18.2	18.5	19.5	21.25

For PAC = 2:

For 0 dBm TX output power, the register setting: PAC = 2 and TBG = 7 are recommended.

For -10 dBm TX output power (low current requirement), PAC = 1 and TBG = 3 is recommended.

## 20. Application circuit

Below are AMICCOM's ref. design module, MD7105-A06, circuit example and its PCB layout.

1. A7105 schematic for RF layouts with single ended 50Ω RF output.
2. C14 and C15 must be matched to the crystal's load capacitance (Cload). Y1 is a 16MHz crystal with 18 pF Cload, max 80ohm ESR and 20 ppm tolerance. Please see application note for detail.

## 2.4G FSK/GFSK Transceiver

MD7105-A06 which size is 12.3mm x 23.3mm with PCB antenna is suitable for small form factor application. MD7105-A06 is based on a design by a double-sided FR-4 board of 0.8mm thickness. All passive components are 0402 size. This PCB has a ground plane on the bottom layer. Additionally, there are ground areas on the component side of the board to ensure sufficient grounding of critical components. Keep sufficient via holes to connect the top layer ground areas to the bottom layer ground plane. **Be notice, IC back side plate shall be well-solder to ground; otherwise, it will impact RF performance.**

To get a good RF performance, a well designed PCB is necessary. A poor layout can lead to loss of RF performance especially on matching networks as well as VDD bypass capacitors. PCB layout of critical traces shall follow AMICCOM's recommended values and layout placement. Long power supply lines on the PCB should be avoided. Keep GND via holes as close as possible to A7105's GND pad and IC back side plate (GND).

Be Notice,

1. IC Back side plate shall be well-solder to ground (U1 area) for good RF performance.
2. Need at least 9 GND via holes at U1 area
