2.4G FSK/GFSK Приемопередатчик

Название документа

Спецификация на A7105, 2.4ГГц FSK/GFSK Приемопередатчик со скоростью передачи данных 2 Кбит/с ~ 500 Кбит/с

История изменений

<u>Изм. No.</u>	<u>История</u>	Дата выпуска	Замечание
0.0	Первоначальный выпуск.	Дек 27, 2007	Предварительный
0.1	Изменена спецификация и добавлен раздел для настройки мощности ТХ	Фев 20, 2008	Предварительный
0.2	Добавлена информацию о маркировке, профиль оплавления, размеры ленты и катушки для транспортировки	Окт. 9 , 2008	Предварительный
0.3	Изменено описание состояния и режима FIFO Переименовано IRQS1/IRQS2 в GIO1S/GIO2S Переименовано GPIO1/GPIO2 в GIO1/GIO2 Добавлены Легкий режим FIFO, Сегментный режим FIFO Удалена функция термодатчика / измерение внешнего напряжения Удалена функция TWWS Добавлена диаграмма состояния быстрого/нормального/энергосберегающего режима FIFO Добавлена диаграмма состояния прямого режима Переименовать MAster Clock F _{CSCK} в F _{MCLK} Измените поддержку скорости передачи данных с 1K~500K на 2K ~ 500K	Янв. 7, 2009	Предварительный
1.0	Пересмотрено описание статуса и режима FIFO Удалены ненужные компоненты схемы в приложении Добавлена кривая RSSI Добавлено руководство по макету	Август, 2009	Полный Производство
1.1	Пересмотрено мин. рабочее напряжение от 1.9V до 2.0V и типичный ток ТХ (0dBm) с 19мА до 20мА	Фев., 2010	Полный Производство
1.2	Добавлено примечание 9 в главу 8, спецификация. Исправлена опечатка на страницах (51, 52, 57, 62, 66, 78, 79).	Ноя., 2010	Полный Производство
1.3	Изменено Английское Название Компании	Ноя. 30, 2010	Полный Производство
1.4	Пересмотрено описание контактов VDA1, VDA2, VDA3 в Ch5. и изменена информация о катушке ленты и добавлен адрес офиса Shenzhen.	Янв., 2011	Полный Производство

A7105

2.4G FSK/GFSK Приемопередатчик

1. Общее описание

А7105 - это высокопроизводительный и недорогой беспроводной приемопередатчик диапазона ISM 2,4 ГГц. Это устройство объединяет в себе как высокочувствительный приемник (-95дБм при 500 Кбит/с), так и высокоэффективный усилитель мощности (до 1 дБм). При низкой скорости передачи данных А7105 обладает особой устойчивостью на дальнем расстоянии прямой видимости из-за своей сверхвысокой чувствительности (-107дБм при 2 Кбит/с, -104дБм при 25 Кбит/с) без необходимости внешней LNA или PA. Регистр скорости передачи данных (0х0Е) позволяет пользователю настроить скорость передачи данных от 2 Кбит/с до 500 Кбит/с.

А7105 имеет быстрое время настройки (130 мкс) для систем скачкообразной перестройки частоты. Для обработки пакетов А7105 имеет встроенный разделенный 64-байтовый ТХ/RX FIFO (может быть расширен до 256 байт) для буферизации данных и пакетной передачи, СRС для обнаружения ошибок, FEC для 1-битной коррекции данных на кодовое слово, RSSI для оценки качества канала, отсеивание данных для шифрования / дешифрования данных. Эти функции очень просты в использовании при разработке беспроводной системы. Все функции интегрированы в небольшой чип QFN 4X4 20 контактов.

К управляющим регистрам A7105 можно легко получить доступ через 3-проводную или 4-проводную шину SPI. Для экономии энергии A7105 поддерживает спящий режим, режим ожидания. Для удобства использования A7105 имеет уникальный набор команд SPI под названием Strobe commAnd, которые используются для управления. Основываясь на стробоскопических командах через шину SPI, MCU может управлять всем: от энергосбережения, отправки ТХ, приема RX, мониторинга каналов, скачкообразной перестройки частоты до автоматической калибровки. Кроме того, A7105 поддерживает две линии ввода-вывода общего назначения, GIO1 и GIO2, чтобы сообщить MCU его статус, чтобы MCU мог использовать либо опрос, либо схему прерывания для выполнения радиоуправления. Следовательно, очень легко контролировать радиопередачу между MCU и A7105 из-за его цифрового интерфейса.

2. Типичные области применения

- Беспроводные клавиатуры и мыши
- Дистанционное управление
- Радиоуправление вертолетом и самолетом
- 2400 ~ 2483.5 МГц ISM система
- Беспроводное измерение и автоматизация зданий
- Беспроводные игрушки и игровые контроллеры

3. Характеристики

- Малый размер (QFN4 X4, 20 контактов).
- Частотный диапазон: 2400 ~ 2483.5МГц.
- FSK или GFSK модуляция
- Низкое потребление тока: RX 16мA, TX 20мA (при выходной мощности 0 дБм).
- Низкий ток сна (1.5 мкА).
- Имеет регулятор напряжения, поддерживаемое напряжение 2.0 ~ 3.6 В.
- Программируемая скорость передачи данных от 2 Кбит/с до 500 Кбит/с.
- Программируемый уровень мощности ТХ от 20 дБм до 1 дБм.
- Сверхвысокая чувствительность:
 - -95дБм при скорости передачи данных 500Кбит/с.
 - ◆ -97дБм при скорости передачи данных 250Кбит/с
 - -104дБм при скорости передачи данных 25Кбит/с
 - -107дБм при скорости передачи данных 2Кбит/с
- Быстрое время настройки (130 us) для системы скачкообразной перестройки частоты.
- Встроенный детектор батареи.
- Поддержка недорогого генератора (6 / 8 /12 / 16 / 20 / 24МГц).
- Поддержка совместного использования генератора, (1 / 2 / 4 / 8МГц) с MCU.
- Поддержка частотной компенсации.
- Простота использования.
 - ◆ Поддержка 3-проводного или 4-проводного SPI.
 - ◆ Уникальная стробоскопическая команда через SPI.
 - Настройка ОДНОГО регистра для новой частоты канала.
 - 8-битный цифровой RSSI для четкой индикации канала.
 - Режим быстрого обмена при переключении ролей TRX.
 - ◆ Автоматическое измерение RSSI.
 - Автоматическая калибровка.
 - Автоматическая функция IF.
 - Автоматическая проверка CRC.
 - ◆ Авто FEC (7, 4) код Хэмминга (1 бит коррекции ошибок/кодовое слово).

2.4G FSK/GFSK Приемопередатчик

- Отсеивание данных для шифрования и дешифрования.
- ◆ Разделенные 64 байта RX и TX FIFO.
- ◆ Простое расширение FIFO / Segment FIFO / FIFO (до 256 байт).
- ◆ Поддержка прямого режима тактового выхода на МСU.
- ◆ Поддержка режима FIF с сигналом синхронизации кадров с МСU.

5. Описание контактов (І: ввод; О: вывод, І/О: ввод и вывод)

Контакт No.	Обозначение	1/0	Описание функции
1	RSSI	0	Подключен к байпасному конденсатору для считывания RSSI.
2	BPBG	0	Соединен с байпасным конденсатором для внутренней точки смещения регулятора
3	RFI	1	Вход усилителя с низким уровнем шума.
4	RFO	0	Выход усилителя мощности. (питается от VDA1)
5	VDA2	I/O	Источник напряжения TRX (от внутреннего аналогового регулятора IC) , подключенный к байпасному конденсатору.
6	VT	- 1	Вход управления частотой VCO
7	GND	G	Земля
8	ΧI	1	Входной узел кварцевого генератора
9	XO	0	Выходной узел кварцевого генератора
10	VDA3	I	Источник напряжения (от VDA1, конт. 20) для PLL
11	SCS	I	3-проводный SPI выбор чипа.
12	SCK	I	3-проводный SPI тактирование.
13	DVDD	I	Источник напряжения TRX (от внутреннего цифрового регулятора IC), подключенный к байпасному конденсатору.
14	SDIO	I/O	3-проводный SPI для чтения/записи данных SPI.
15	GND	G	Земля
16	GIO1	I/O	Многофункциональный GIO 1 / 4-проводной вывод данных SPI.
17	GIO2	I/O	Многофункциональный GIO 2 / 4-проводной вывод данных SPI.
18	СКО	0	Многофункциональный тактовый выход.
19	REGI	_	Вход внутреннего регулятора (Внешний Вход Питания)
20	VDA1	I/O	Выход внутреннего аналогового регулятора для питания RFO (конт. 4) и VDA3 (конт. 10).
	Задняя пластина	G	Земля. Задняя пластина должна быть хорошо припаяна к земле; в противном случае это повлияет на радиочастотные характеристики.

	MM	± 100	В

^{*}Напряжения, превышающие значения, указанные в разделе "Абсолютный максимум номинальных параметров", могут привести к необратимому повреждению устройства. Это только номинальные напряжения; функциональная работа устройства при этих или любых других условиях, превышающих указанные в эксплуатационных разделах настоящей спецификации, не подразумевается. Воздействие абсолютных максимальных номинальных условий в течение длительного периода времени может повлиять на надежность устройства.

^{*} Прибор имеет уровень чувствительности к влаге III (MSL 3).

^{*} Устройство чувствительно к ESD. Используйте соответствующие меры предосторожности при ESD. HBM (Режим человеческого тела) тестируется по методу MIL-STD-883FMethod 3015.7. MM (Машинный режим) тестируется по методуJEDEC EIA/JESD22-A115-A.

9. Управляющие регистры

A7105 содержит 51 х 8-бит управляющий регистр. МСU может получить доступ к этим управляющим регистрам через 3-проводный (SCS, SCK, SDIO) или 4-проводный (SCS, SCK, SDIO, GIO1/GIO2) SPI-интерфейс (поддержка макс. скорость передачи данных SPI до 10 Мбит/с). Пользователь может обратиться к главе 10 для получения подробной информации о временных задержках SPI. A7105 управляется просто регистрами и выводит свое состояние на микроконтроллер выводами GIO1 и GIO2.

9.2 Описание управляющих регистров

9.2.1 Регистр Mode (Адрес: 00h)

Имя	R/W	Бит 7	Бит 6	Бит 5	Бит 4	Бит 3	Бит 2	Бит 1	Бит 0
Mode	R		FECF	CRCF	CER	XER	PLLER	TRSR	TRER
	W	RESETN							
Сброс									

RESETN: Запись в этот регистр 0x00 приведет к выдаче команды сброса, после регистр автоматически очистится

FECF: FEC флаг.

[0]: FEC пройдено. [1]: FEC ошибка. (FECF доступен только для чтения, обновляется при приеме каждого пакета.)

CRCF: CRC флаг.

[0]: CRC пройдено. [1]: CRC ошибка. (CRCF доступен только для чтения, обновляется при приеме каждого пакета.)

CER: Статус включения радиочастотного(RF) чипа.

[0]: RF чип выключен. [1]: RF чип включен.

XER: Статус включения внутреннего кварцевого генератора.

[0]: Кварцевого генератора выключен. [1]: Кварцевого генератора включен.

PLLE: Статус включения PLL.

[0]: PLL выключено. [1]: PLL включено.

TRER: Состояние включения TRX.

[0]: TRX выключено. [1]: TRX включено.

TRSR: Регистр состояния TRX. [0]: Прием(RX). **[1]:** Передача(TX).

Пригодный, если TRER=1 (TRX включено).

9.2.2 Регистр Mode Control (Адрес: 01h)

Имя	R/W	Бит 7	Бит 6	Бит 5	Бит 4	Бит 3	Бит 2	Бит 1	Бит 0
Mode Control I	R	DDPC	ARSSI	AIF	DFCD	WWSE	FMT	FMS	ADCM
	W	DDPC	ARSSI	AIF	CD	WWSE	FMT	FMS	ADCM
Сброс		0	0	0	0	0	0	0	0

DDPC: В прямом режиме, если DDPC=1, MCU отправляет/получает необработанные данные пакета через SDIO контакт вместо GIO1 или GIO2 пинов.

[0]: Выключено. [1]: Включено.

ARSSI: Автоматическое измерение RSSI при входе в режим RX.

[0]: Выключено. [1]: Включено.

AIF (Авто смещение IF): LO частота RF будет автоматически смещаться на одну IF частоту при входе в режим RX.

[0]: Выключено. [1]: Включено.

CD / DFCD: DFCD (Фильтр данных по CD): Полученный пакет будет отфильтрован, если CD неактивен.

[0]: Выключено. [1]: Включено.

СD (Только для чтения): Сигнал детектора несущей.

[0]: Входная мощность ниже порога. [1]: Входная мощность выше порога.

WWSE: Зарезервировано для внутренних нужд. Должно быть установлено значение [0].

FMT: Зарезервировано для внутренних нужд. Должно быть установлено значение [0].

FMS: Выбор режима Direct/FIFO. [0]: Direct режим. [1]: FIFO режим.

10. SPI

A7105 only supports one SPI interface with MAximum data rate up to 10Mbps. MCU should assert SCS pin low (SPI chip select) to active accessing of A7105. Via SPI interface, user can access **control registers** and issue **Strobe commAnd**. Figure 10.1 gives an overview of SPI access MAnners.

3-wire SPI (SCS, SCK and SDIO) or 4-wire SPI (SCS, SCK, SDIO and GIO1/GIO2) configuration is provided. For 3-wire SPI, SDIO pin is configured as bi-direction to be data input and output. For 4-wire SPI, SDIO pin is data input and GIO1 (or GIO2) pin is data output. In such case, GIO1S (0bh) or GIO2S (0ch) should be set to [0110].

For SPI write operation, SDIO pin is latched into A7105 at the rising edge of SCK. For SPI read operation, if input address is latched by A7105, data output is aligned at falling edge of SCK. Therefore, MCU can latch data output at the rising edge of SCK.

To control A7105's internal state MAchine, it is very easy to send Strobe commAnd via SPI interface. The Strobe commAnd is a unique commAnd set with total 8 commAnds. See section 10.3, 10.4 and 10.5 for details.

	SPI chip select	Data In	Data Out
3-Wire SPI	SCS pin = 0	SDIO pin	SDIO pin
4-Wire SPI	SCS pin = 0	SDIO pin	GIO1 (GIO1S=0110) / GIO2 (GIO2S=0110)

10.1 Формат SPI

Первый бит (A7) указывает для A7105 тип инструкции - "Управляющие регистры" или "Стробоскопическая команда". См. Таблицу 10.1 для формата SPI. Исходя из таблицы 10.1, для доступа к управляющим регистрам достаточно установить A7=0, затем бит A6, который используется для обозначения операции чтения (A6=1) или записи (A6=0). Подробнее см. Рис. 10.2 (3-проводный SPI) и рис. 10.3 (4-проводный SPI).

10.2 Временные характеристики SPI

Независимо от того, настроен ли 3-проводной или 4-проводной интерфейс SPI, максимальная скорость передачи данных SPI составляет 10 Мбит/с. Для активации интерфейса SPI вывод CS должен быть установлен в низкий уровень. Для правильной фиксации данных пользователь должен позаботиться о времени удержания и времени настройки между SCK и SDIO. См. Таблицу 10.2 Временные характеристики SPI.

10.2 Стробоскопические команды

A7105 поддерживает 8 строб-команд для управления внутренними настройками чипа. Таблица 10.3 отображает их.

Обратите внимание, что строб может быть 4-битный или 8-битный (А7~A0). Если 8-битный, то последние 4 бита (А3~A0) учитываться не будут. В таком случае, вывод SCS может оставаться низким для принятия следующих команд.

10.3 Команда сброса

В дополнение к сбросу питания (POR) МСИ может выполнить программный сброс A7105, установив регистр (00h) через интерфейс SPI, как показано ниже. До тех пор, пока 8-битный адрес (A7~A0) равен нулю, и данные (D7~D0) равны нулю, A7105 получает информацию для генерации внутреннего сигнала "RESETN" для инициализации самого себя. После команды сброса A7105 находится в режиме ожидания (standby mode), и процедура калибровки должна быть выполнена снова.

10.4 Команды доступа к ID

А7105 имеет встроенный 32-битный идентификационный регистр для индивидуального идентификатора. Доступ к нему осуществляется через интерфейс SPI. Длину идентификатора рекомендуется оставлять 32 бита, установив IDL (регистр 1Fh). Пользователь может переключить вывод SCS на высокий, чтобы завершить команду доступа к ID, когда данные ID полностью переданы.

На рис.10.13 и 10.14 представлены временные диаграммы обращения к 32-битному ID через 3-проводный SPI.

10.4.1 Команда записи ID

Пользователь может подробно ознакомиться с временной диаграммой записи SPI на рис.10.2. Ниже приведена процедура выполнения команды записи ID.

- Шаг 1: Передайте A7~A0 = 00000110 (A6=0 для записи, A5~A0 = 000110 регистр ID DATA, 06h).
- Шаг 2: Через вывод SDIO передайте 32-битный идентификатор в A7105 в последовательности байтов данных 0 (рекомендуется 5хh или Axh), 1, 2 и 3.
- Шаг 3: Переключите вывод SCS на высокий уровень, когда шаг 2 будет завершен.

10.5 Команды доступа к FIFO

To use A7105's FIFO mode, enable FMS (01h) =1 via SPI interface. Before TX delivery, just write wanted data into TX FIFO (05h) then issue TX Strobe commAnd. Similarly, user can read RX FIFO (05h) once payload data is received.

MCU can use polling or interrupt scheme to do FIFO accessing. FIFO status can output to GIO1 (or GIO2) pin by setting GIO1S (0Bh) or GIO2S (0Ch).

Figure 10.15 and 10.16 are timing charts of FIFO accessing via 3-wire SPI.

10.5.1 Команда записи ТХ FIFO

Пользователь может подробно ознакомиться с временной диаграммой записи SPI на рис.10.2. Ниже приведена процедура записи TX FIFO.

- Шаг 1: Поставьте $A7 \sim A0 = 00000101$ (A6 = 0 управляющий регистр для записи FIFO по адресу 05h).
- Шаг 2: С помощью вывода SDIO отправьте (n+1) байтов данных TX в TX FIFO последовательно байтами данных от 0, 1, 2 до n.
- Шаг 3: Переключите вывод SCS на высокий уровень, когда шаг 2 будет завершен.
- Шаг 4: Отправьте стробоскопическую команду режима ТX (рис. 10.9), чтобы выполнить отправку ТX.

10.5.2 Команда чтения Rx FIFO

Пользователь может подробно ознакомиться с временной диаграммой чтения SPI на рис.10.2. Ниже приведена процедура чтения RX FIFO.

- Шаг 1: Поставьте $A7 \sim A0 = 01000101$ (A6 = 1 управляющий регистр для чтения FIFO по адресу 05h).
- Шаг 2: Вывод SDIO выводит данные RX из RX FIFO последовательно по байтам данных от 0, 1, 2 до n.
- Шаг 3: Переключите вывод SCS на высокий уровень, когда RX FIFO будет полностью считан.

11. State мAchine

In chapter 9 and chapter 10, user can not only learn A7105's control registers but also know how to issue Strobe commAnd. From section 10.2 ~ 10.6, it is clear to know configurations of 3-wire SPI and 4-wire SPI, Strobe commAnd, software reset, and how to access ID Registers as well as TX/RX FIFO.

Section 11.1 introduces 7 states of built-in state MAchine. Combined with Strobe commAnd and accessing control registers, section 11.2, 11.3 and 11.4 demonstrate 3 state diagrams to explain how transitions of A7105's operation.

From accessing data point of view, if FMS=1 (01h), FIFO mode is enabled, otherwise, A7105 is in direct mode. If FMS=1 and FIFO Read/Write in Standby mode, we call it NormAl FIFO mode. Otherwise, If FMS=1 and FIFO Read/Write in PLL mode, we called it Quick FIFO mode due to the time reduction of PLL settling. If FMS=1 and FIFO Read/Write in IDLE mode, we called it Power Saving FIFO mode due to the reduction of average current.

	SPI chip select	Data In	Data Out	Operation Mode	Clock Recovery for Direct Mode
3-Wire SPI	SCS pin = 0	SDIO pin	SDIO pin	FIFO (FMS=1) Direct (FMS=0)	CKO pin (CKOS = 0001)
4-Wire SPI	SCS pin = 0	SDIO pin	GIO1 (GIO1S=0110) / GIO2 (GIO2S=0110)	FIFO (FMS=1) Direct (FMS=0)	CKO pin (CKOS = 0001)

(1) NormAl FIFO Mode (FMS=1 and FIFO R/W @ Standby mode)

(2) Quick FIFO Mode (FMS=1 and FIFO R/W @ PLL mode)
(3) Power Saving FIFO Mode (FMS=1 and FIFO R/W @ IDLE mode)

(4) Quick Direct Mode (FMS=0 and FIFO ignored, write packet @ TX mode, read packet @ RX mode)

11.1 Key states

A7105 supports 7 key operation states. Those are

- (1) Standby mode
- (2) Sleep mode
- (3) Idle mode
- (4) PLL mode
- (5) TX mode
- (6) RX mode
- (7) CAL mode

After power on reset or software reset, A7105 is in standby mode. User has to do calibration process because all control registers are in initial values. The calibration process is very easy, user only needs to issue Strobe commands and enable calibration registers. Then, check the calibration flag because it is done automatic by internal state machine. Refer to 11.2, 11.3, 11.4 and chapter 15 for details. After calibration, A7105 is ready to do TX and RX operation.

11.1.1 Standby mode

If Standby Strobe commAnd is issued, A7105 enters standby mode automAtically. Internal power mAnagement is listed below. Be notice, A7105 is in standby mode once power on reset or software reset occurs.

11.1.2 Sleep mode

If Sleep Strobe commAnd is issued, A7105 enters sleep mode automAtically. In sleep mode, A7105 still can accept MCU's commAnds via SPI interface. But, NOT support to Read/Write FIFO. Internal power mAnagement is listed below.

	Sleep mode							
On Chip Regulator	Crystal Oscillator	VCO	PLL	RX Circuitry	TX Circuitry	Strobe CommAnd		
OFF	OFF	OFF	OFF	OFF		1000xxxxb See Figure 10.4		

11.1.3 Idle mode

If Idle Strobe command is issued, A7105 enters idle mode automatically. In idle mode, A7105 can accept MCU's commands via SPI interface as well as supporting Read/Write FIFO. Internal power Management is listed below.

	Idle mode							
On Chip Regulator	Crystal Oscillator	VCO	PLL	RX Circuitry	TX Circuitry	Strobe CommAnd		
ON	OFF	OFF	OFF	OFF	OFF	1001xxxxb See Figure 10.5		

11.1.4 PLL mode

If PLL Strobe commAnd is issued, A7105 enters PLL mode automAtically. In PLL mode, internal PLL and VCO are both turned on to generate LO (local oscillator) frequency before TX and RX operation. Internal power MAnagement is listed below. According to PLL Register I, II, III, IV and V, PLL circuitry is easy to be controlled by user's definition.

	PLL mode					
On Chip Regulator	Crystal Oscillator	VCO	PLL	RX Circuitry	TX Circuitry	Strobe CommAnd
ON	ON	ON	ON	OFF		1011xxxxb See Figure 10.7

11.1.5 TX mode

If TX Strobe commAnd is issued, A7105 enters TX mode automAtically for data delivery. Internal power mAnagement is listed below.

- (1) In FIFO mode, once TX data packet (Preamble + ID + Payload) is delivered, A7105 supports auto-back function to previous state for next delivered packet.
- (2) In Direct mode, once TX data packet is delivered, A7105 stays in TX mode. User has to issue Strobe commAnd to back to previous state.

	TX mode							
On Chip Regulator	Crystal Oscillator	VCO	PLL	RX Circuitry	TX Circuitry	Strobe CommAnd		
ON	ON	ON	ON	OFF	ON	(1101xxxx)b See Figure 10.9		

11.1.6 RX mode

If RX Strobe commAnd is issued, A7105 enters RX mode automAtically for data receiving. Internal power mAnagement is listed below.

11.1.7 CAL mode

Calibration process shall be done after power on reset or software reset. Calibration items include VCO and IF Filter. It is easy to implement calibration process by Strobe commAnd and enable CALC (02h) control register. See chapter 15 for details.

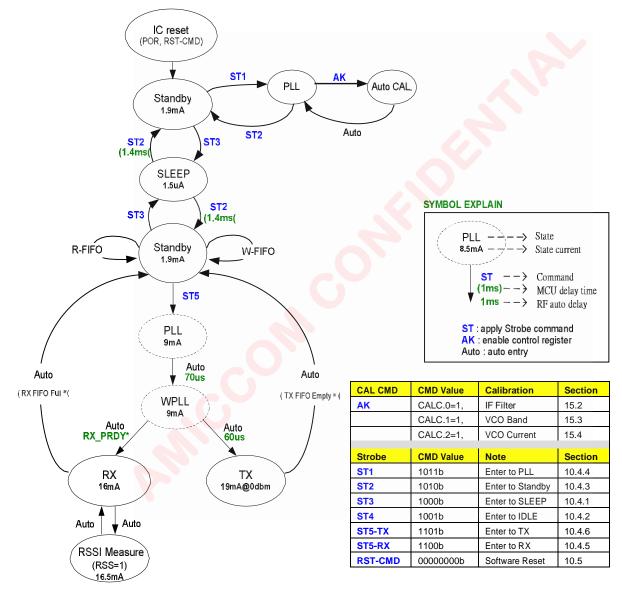

Be notice, VCO Calibration is only executable in PLL mode. However, IF Filter Calibration can be executed in Standby or PLL mode.

11.2 NormAl FIFO Mode

This mode is suitable for requirement of general purpose applications. After calibration flow, user can issue Strobe commAnd to enter standby mode where write TX FIFO or read RX FIFO. From standby mode to packet transmission, only one Strobe commAnd is needed. Once transmission is done, A7105 is auto back to standby mode. If all packets are finished and deeper power saving is necessary, user can issue Strobe commAnd to ask A7105 staying in sleep mode. Figure 11.1 is the state diagram of NormAl FIFO mode.

- Refer to chapter 16 for definition of RX FIFO Full and TX FIFO Empty.

11.3 Quick FIFO Mode

This mode is suitable for requirement of fast transceiving. After calibration flow, user can issue Strobe command to enter PLL mode where write TX FIFO or read RX FIFO. From PLL mode to packet data transceiving, only one Strobe command is needed. Once transceiving is finished, A7105 is auto back to PLL mode.

When packets are finished and deeper power saving is necessary, user can issue Strobe commAnd to ask A7105 staying in sleep mode. Figure 11.4 is the state diagram of Quick FIFO mode.

11.4 Power Saving FIFO Mode

This mode is suitable for requirement of low power consumption. After calibration flow, user can issue Strobe commAnd to enter idle mode where write TX FIFO or read RX FIFO. From idle mode to packet data transceiving, only one Strobe commAnd is needed. Once transmission is done, A7105 is auto back to idle mode.

When packets are finished and deeper power saving is necessary, user can issue Strobe commAnd to ask A7105 staying in sleep mode. Figure 11.7 is the state diagram of Power Saving FIFO mode.

- Refer to chapter 16 for definition of RX FIFO Full and TX FIFO Empty.
- See Table 11.9 (next page) for RX-PRDY...

11.5 Quick Direct Mode

This mode is suitable for fast transceiving. After calibration flow, for every state transition, user has to issue Strobe commAnd to A7105. This mode is also suitable for the requirement of versatile packet formAt. Noted that user needs to take care the transition time by MCU's timer.

When packets are finished and deeper power saving is necessary, user can issue Strobe commAnd to ask A7105 staying in idle mode (or sleep mode). Figure 11.3 is the state diagram of Quick Direct mode.

From Figure 11.10, After A7105 enters TX mode, MCU should immediately deliver preamble. Therefore, user can send dummy preamble since WTR goes high or plus a delay loop to MAke sure dummy preamble is 10 bits at least before DCK is active. See below figure for detail timing.

From Figure 11.10, in RX mode, A7105 will check received ID compared to ID register (06h). If ID is MAtched, FSYNC will be output. MCU can decode received ID and payload from GIO1 pin (TRXD) via rising edge of RCK (recovery clock). Then, GIO2 pin can be used to inform MCU reference timing by PMDO (Preamble Detect Output) or FSYNC (Frame Sync).

12 Crystal Oscillator

A7105 needs external crystal or external clock that is either 6 or 8/12/16/20/24 MΓμto generate internal wanted clock. Be noted if external clock is equal or lower than 8MHz, A7105 only supports data rate up to 250K.

12.1 Use External Crystal

Figure 12.1 shows the connection of crystal network between XI and XO pins. C1 and C2 capacitance are used to adjust different crystal loading. A7105 supports crystal accuracy within ±20 ppm under firmware frequency compensation. Be noted that crystal accuracy requirement includes initial tolerance, temperature drift, aging and crystal loading.

12.2 Use external clock

A7105 has built-in AC couple capacitor to support external clock input. Figure 12.2 shows how to connect. In such case, XI pin is left opened. XS shall be low (0Dh) for selecting external clock. The frequency accuracy of external clock shall be controlled within \pm 20 ppm, and the amplitude of external clock shall be within 1.2 ~ 1.8 V peak-to-peak.

13. System Clock

A7105 supports different crystal frequency by programmAble "Clock Register" (0Dh). Based on this, three important internal clocks F_{CGR} , F_{DR} and F_{SYCK} are generated.

- (1) F_{XTAL}: Crystal frequency.
- (2) F_{XREF}: Crystal Ref. Clock = F_{XTAL} * (DBL+1).
- (3) F_{CGR} : Clock Generation Reference = $2M\Gamma \mu = F_{XREF} / (GRC+1)$, where F_{CGR} is used to generate 32M PLL.
- (4) F_{MCLK}: MAster Clock is either F_{XREF}: or 32M PLL, where F_{MCLK} is used to generate F_{SYCK}.
- (5) F_{SYCK}: System Clock = 16MHz=F_{MCLK} / CSC= 32 * F_{IF}, where F_{IF} is recommended to set 500ΚΓμ.
- (6) F_{DR}: Data Rate Clock = F_{IF} / (SDR+1).
- (7) F_{FPD} : VCO Compared Clock = = F_{XREF} / (RRC+1).

13.2 Enable clock generation

If crystal frequency is the multiplier of $2M\Gamma\mu$ and larger than 6MHz, set CGS = 1 to enable $F_{SYCK} = 32M\Gamma\mu$ (internal $32M\Gamma\mu$ PLL). The comparison frequency of clock generator F_{CGR} shall be $2M\Gamma\mu$ by setting GRC[3:0] to meets the below equations.

 $F_{CRG} = F_{XTAL} * (1+DBL) / (GRC+1) = 2MHz.$ $F_{DR} = F_{SYCK} / 32 / (SDR+1).$

14. Transceiver LO Frequency

A7105 is a half-duplex transceiver with embedded PA and LNA. For TX or RX frequency setting, user just needs to set up LO (Local Oscillator) frequency for two ways radio transmission.

To target full range of 2.4ΓΓ μ ISM band (2400 MΓ μ to 2483.5 MHz), A7105 applies offset concept by LO frequency $F_{LO} = F_{LO_BASE} + F_{OFFSET}$. Therefore, this device is easy to implement frequency hopping and multi-channels by just **ONE** register setting, **PLL Register I (CHN [7:0], 0Eh)**.

Below is the LO frequency block diagram.

14.1 LO Frequency Setting

From Figure 14.1, F_{LO} is not only for TX radio frequency but also to be RX LO frequency. To set up F_{LO}, it is easy to implement by below 4 steps.

- 1. Set the base frequency (F_{LO_BASE}) by PLL Register II, III, IV and V (10h, 11h, 12h and 13h). Recommend to set F_{LO_BASE} ~ 2400.001MHz.
- 2. Set the channel step (F_{CHSP}) by PLL Register II (10h).
 - $F_{CHSP} = F_{XTAL} * (DBL+1) / 4 / (CHR+1), Recommend <math>F_{CHSP} = 500 \text{ KF} \text{ µ}.$
- Set CHN [7:0] to get offset frequency by PLL Register I (0Fh).
 F_{OFFSET} = CHN [7:0] x F_{CHSP}
- 4. LO frequency is equal to base frequency plus offset frequency.

$$F_{LO} = F_{LO_BASE} + F_{OFFSET}$$

F_{LO_BASE}

$$F_{\text{LO_BASE}} = F_{\text{PFD}} \cdot (BIP[8:0] + \frac{BFP[15:0]}{2^{16}}) = (DBL+1) \cdot \frac{F_{XTAL}}{RRC[1:0]+1} \cdot (BIP[8:0] + \frac{BFP[15:0]}{2^{16}})$$

Base on the above formula, for example, if $F_{XTAL} = 16$ MF $_{LO}$, see Table 14.1, 14.2, and Figure 14.2 for details.

In two ways radio, both MAster and slave have two roles, TX and RX. In general, slave usually has to reply an ACK-packet or status update. In such case, A7105 offers two methods to set up **F**_{LO} while TRX exchanging.

- (1) Auto IF exchange
- (2) Fast exchange

14.2.1 Auto IF Exchange

A7105 supports Auto IF offset function (AIF, 01h). If AIF is enabled, only one on-air occupied frequency (Fcarrier). In this case, user has no need to change F_{RXLO} while TRX exchanging because F_{RXLO} is auto shifted F_{IF} . See below Figures and Table 14.4 for details.

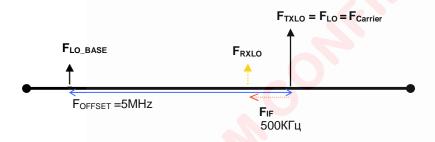

<MAster>

AIF=1 and ULS=0, F_{RXLO} is auto shifted lower than F_{TXLO} for 500KF μ (F_{IF}).

<Slave>

AIF=1 and ULS=0, F_{RXLO} is auto shifted lower than F_{TXLO} for 500KF μ (F_{IF}).

14.2.2 Fast Exchange

To reduce PLL settling time, user can disable AIF function. If AIF is disabled, two On-air frequency ($F_{Carrier (MAster)}$, $F_{Carrier (slave)}$) are occupied. In this case, user has to control ULS =0 (MAster side) and ULS = 1 (Slave side) for fast exchange in two-way radio. See below Figures and Table 14.5 for details.

<MAster> AIF=0 and ULS=0, MAster is set Up side band.

Item	Role	AIF	ULS	CHN[7:0]	F _{CHSP} (КГц)	F _{TXLO} (КГц)	F _{RXLO} (MHz)	NOTE
MAster	TX	0	0	10	500	2405.001	ı	
	RX	0	0	10	500	ı	2405.001	Up side band

14.3 Frequency Compensation

Frequency Compensation function (FC) supports low accuracy crystal (± 20 ppm) without sensitivity degradation. The FC concept is to fine tune RX LO frequency (F_{RXLO}). MCU can read AC[14:0], (12h) and (13h), to executes frequency drift calculation and update new setting to PLL IV (12h) and PLL V (13h) to adjust the best RX LO frequency (F_{RXLO}).

15. Calibration

A7105 needs calibration process after power on reset or software reset by 3 calibration items, they are, VCO Current, VCO Bank, and IF Filter Bank.

- 1. VCO Current Calibration (Standby or PLL mode) is used to find adequate VCO current.
- 2. VCO Bank Calibration (PLL mode) is used to select best VCO frequency bank for the calibrated frequency.
- 3. IF Filter Bank Calibration (Standby or PLL mode) is used to calibrate IF filter bandwidth and center frequency.

15.1 Calibration Procedure

- 1. Initialize all control registers (refer to A7105 reference code).
- 2. Select calibration mode (set MFBS=0, MVCS =1, MVBS = 0).
- 3. Set A7105 in PLL mode.
- Enable IF Filter Bank (set FBC = 1),
 VCO Current (VCC = 1), and VCO Bank (VBC = 1).
- 5. After calibration done, FBC, VCC and VBC is auto clear.
- Check pass or fail by reading calibration flag. (FBCF) and (VCCF, VBCF).

- 1. Initialize all control registers (refer to A7105 reference code).
- Set MFBS = 0 for auto calibration.
- 3. Set A7105 in PLL mode.
- Set FBC= 1 (02h).
- 5. The MAximum calibration time for this calibration is about 256us.
- FBC is auto clear after calibration done.
- 7. User can read calibration flag (FBCF, 22h) to check pass or fail.
- 8. User can read FB [3:0] (22h) to get the auto calibration value.

16. FIFO (First In First Out)

A7105 supports separated 64-bytes TX and RX FIFO by enabling FMS =1 (01h). For FIFO accessing, TX FIFO (write-only) and RX FIFO (read-only) share the same register address 05h. TX FIFO represents transmitted payload. On the other hand, once RX circuitry synchronizes ID Code, received payload is stored into RX FIFO.

In chapter 10 and 11, user can also find listed FIFO informAtion below.

- (1) Figure 10.15 and 10.16 for FIFO accessing via 3-wire SPI.
- (2) Section 10.4.7 and 10.4.8 for FIFO pointer reset commAnd.
- (3) Figure 11.2 and Figure 11.3 for NorMAI/Quick FIFO mode.

16.1 Packet FormAt

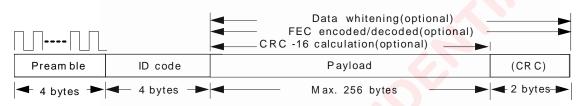

Figure 16.1 Packet FormAt of FIFO mode

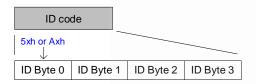

Figure 16.2 ID Code FormAt

Preamble:

The packet is led by preamble composed of alternate 0 and 1. If the first bit of ID code is 0, preamble shall be 0101...0101. In the contrast, if the first bit of ID code is 1, preamble shall be 1010...1010.

Preamble length is recommended to set 4 bytes by PML [1:0] (1Fh).

ID code:

ID code is recommended to set 4 bytes by IDL=1 (1Fh). ID Code is sequenced by Byte 0, 1, 2 and 3 (Recommend to set ID Byte 0 = 5xh or Axh). If RX circuitry checks the ID code correct, received payload will be stored into RX FIFO. In special case, ID code could be set error tolerance (0~ 3bit error) by ETH [1:0] (20h) for ID synchronization check.

Payload:

Payload length is programmAble by FEP [7:0] (03h) from 1 byte to 64 bytes. The physical FIFO depth is 64 bytes. A7105 also supports logical FIFO extension up to 256 bytes. See section 16.4.3 for details.

CRC (option):

In FIFO mode, if CRC is enabled (CRCS=1, 1Fh), 2-bytes of CRC value is transmitted automAtically after payload. In the same way, RX circuitry will check CRC value and show the result to CRC Flag (00h).

16.2 Bit Stream Process

A7105 supports 3 optional bit stream process for payload, they are,

- (1) CCITT-16 CRC $(x^{16} + x^{15} + x^2 + 1)$
- (2) (7, 4) Hamming FEC
- (3) Data Whitening by XOR PN7 (7-bits Pseudo Random Sequence).

CRC (Cyclic Redundancy Check):

- CRC is enabled by CRCS= 1 (1Fh). TX circuitry calculates the CRC value of payload (preamble, ID code excluded) and transmits 2-bytes CRC value after payload.
- 2. RX circuitry checks CRC value and shows the result to CRC Flag (00h). If CRCF=0, received payload is correct, else error occurred. (CRCF is read only, it is revised internally while receiving every packet.)

FEC (Forward Error Correction):

- 1. FEC is enabled by FECS= 1 (1Fh). Payload and CRC value (if CRCS=1) are encoded by (7, 4) Hamming code.
- 2. Each 4-bits (nibble) of payload is encoded into 7-bits code word as well as delivered out automAtically. (ex. 64 bytes payload will be encoded to 128 code words, each code word is 7 bits.)
- 3. RX circuitry decodes received code words automAtically. FEC supports 1-bit error correction each code word. Once 1-bit error occurred, FEC flag=1 (00h). (FECF is read only, it is revised internally while receiving every packet.)

Data Whitening:

- Data whitening is enabled by WHTS= 1 (1Fh). The initial seed of PN7 is WS [6:0] (21h). Payload is always encrypted by bit XOR operation with PN7. CRC and/or FEC are also encrypted if CRCS=1 and/or if FECS=1.
- 2. RX circuitry decrypts received payload and 2-bytes CRC (if CRCS=1) automAtically. Be notice, user shall set the same WS [6:0] (21h) to TX and RX.

16.4 Usage of TX and RX FIFO

In application points of view, A7105 supports 3 options of FIFO arrangement.

- (1) Easy FIFO
- (2) Segment FIFO
- (3) FIFO Extension

For FIFO operation, A7105 supports Strobe commAnd to reset TX and RX FIFO pointer as shown below. User can refer to section 10.5 for FIFO write pointer reset and FIFO read pointer reset.

16.4.1 Easy FIFO

In Easy FIFO, MAX FIFO length is 64 bytes. FIFO length is equal to **(FEP [7:0] +1)**. User just needs to control FEP [7:0] (03h) and disable PSA and FPM as shown below.

Register setting

2.4G FSK/GFSK Transceiver

In Segment FIFO, TX FIFO length is equal to (FEP [7:0] — PSA [5:0] + 1). FPM [1:0] should be zero. This function is very useful for button applications. In such case, each button is used to transmit fixed code (data) every time. During initialization, each fixed code is written into corresponding segment FIFO once and for all. Then, if button is triggered, MCU just assigns corresponding segment FIFO (PSA [5:0] and FEP [7:0]) and issues TX strobe commAnd.

If TX FIFO is arranged into 8 segments, each TX segment and RX FIFO length are 8 bytes

16.4.3 FIFO Extension

In FIFO Extension, payload is programmAble up to 256 bytes. In this mode, SPI data rate is important to prevent error operation of FIFO extension. Therefore, MCU's SPI data rate shall be **faster than A105 on-air data rate**. Then, FPM [1:0] is used to set FIFO Pointer Flag (FPF) to inform MCU correct timing to write TX-FIFO or read RX-FIFO. FIFO pointer Flag (FPF) is output to pin CKO by set CKOS = [0010] (0AH).

Procedures of TX FIFO Extension

- Initialize all control registers (refer to A7105 reference code).
- 2. Set FEP [7:0] = 0xFF for 256-bytes FIFO extension.
- 3. Set FPM [1:0] = 11 for FPF trigger condition.
- 4. Refer to section 11.2 ~ 11.4.
- 5. Send Strobe commAnd TX FIFO write pointer reset.
- 6. MCU writes 1st 64-bytes TX FIFO.
- 7. Send TX Strobe commAnd.

- 2. Set FEP [7:0] = 0xFF for 256-bytes FIFO extension.
- 3. Set FPM [1:0] = 11b for FPF trigger condition.
- 4. Set CKO Register = 0x12
- 5. Send Strobe commAnd RX FIFO read pointer reset.
- 6. Send RX Strobe comмAnd.
- 7. MCU monitors FPF from A7105's CKO pin.
- 8. FPF triggers MCU to read 1st 48-bytes RX FIFO.
- 9. Monitor FPF.
- 10. FPF triggers MCU to read 2nd 48-bytes RX FIFO.
- 11. Monitor FPF.
- 12. FPF triggers MCU to read 3rd 48-bytes RX FIFO.
- 13. Monitor FPF.
- 14. FPF triggers MCU to read 4th 48-bytes RX FIFO.
- 15. Monitor FPF.
- 16. FPF triggers MCU to read 5th 48-bytes RX FIFO.
- 17. Monitor WTR falling edge or WTR = low, read the rest 16-bytes RX FIFO
- 18. Done.

17.1 RSSI Measurement

A7105 supports 8-bits digital RSSI to detect RF signal strength. RSSI value is stored in ADC [7:0] (1Dh). Fig 17.1 shows a typical plot of RSSI reading as a function of input power. This curve is base on the current gain setting of A7105 reference code. A7105 automAtically averages 8-times ADC conversion a RSSI measurement until A7105 exits RX mode. Therefore, each RSSI measuring time is ($8 \times 20 \times F_{ADC}$). For quick RSSI measurement, recommend to set FSARS = 1 (F_{ADC} =8MHz, 20 us measuring time). For power saving, recommend to set FSARS = 0 (F_{ADC} =4MHz, 40 us measuring time). Be aware RSSI accuracy is about \pm 6dBm.

Auto RSSI measurement for TX Power:

- 1. Set wanted F_{RXLO} (Refer to chapter 14).
- 2. Set RSS= 1 (1Eh), FSARS= 0 (1Eh, 4ΜΓμADC clock).
- 3. Enable ARSSI= 1 (01h).
- 4. Send RX Strobe comмAnd.
- 5. In RX mode, 8-times average a RSSI measurement periodically.
- Exit RX mode, user can read digital RSSI value from ADC [7:0] (1Dh) for TX power.

In step 6, if A7105 is set in direct mode, MCU shall let A7105 exit RX mode within 40 us to prevent RSSI inaccuracy.

17.2 Carrier Detect

Base on RSSI measurement, user can extend its application to do carrier detect (CD). In Carrier Detect mode, RSSI is refresh every 5 us without 8-times average. If RSSI level is below threshold level (RTH), CD is output high to GIO1 or GIO2 pin to inform MCU that current channel is busy.

Below is a reference procedure:

- 1. Set RTH (1Dh) for absolute RSSI threshold level (ex. RTH = 80d).
- 2. Set GIO2S = [0010] (0Ch) for Carrier Detect to GIO2 pin.
 - (2-1) Set wanted F_{RXLO} (Refer to chapter 14).
 - (2-2) Set RSS= 1 (1Eh), FSARS= 0 (1Eh, 4ΜΓμADC clock), RSM= [11] (1Eh, hysteresis, 20d).
 - (2-3) Enable ARSSI= 1 (01h).
 - (2-4) Send RX Strobe commAnd.
 - (2-5) MCU enables a timer delay (min. 100 us).
- 3. MCÚ checks GIO2 pin.
 - (3-1) If ADC \geq (RTH+RSM), GIO2 = 0.
 - (3-2) If ADC \leq (RTH), GIO2 = 1.
 - (3-3) If ADC locates in hysteresis zone, GIO2 = previouse state.
- 4. Exit RX mode.

Below is the procedure to detect low voltage input (ex. below 2.1V):

- 1. Set A7105 in standby or PLL mode.
- 2. Set BVT (27h) = [001] and enable BDS (27h) = 1.
- 3. After 5 us, BDS is auto clear.
- MCU reads BDF (27h).
 If REGI pin > 2.1V,
 BDF = 1 (battery high). Else, BDF = 0 (battery low).

19 TX power setting

A7105 supports programмAble TX power from – 20дБм~ 1 дБмby TX test register (28h). User can configures PAC[1:0] and TBG[2:0] for different TX power level. The following tables show the typical TX power vs. current in different settings..

For PAC = 3:

TBG	0	1	2	3	4	5	6	7
TX output (dBm)	-17.6	-14.5	-10	-7.2	-5.1	-3.5	-0.5	1.3
Current (мА)	17.6	17.7	17.78	18.1	18.2	18,5	19.5	21.25

For PAC = 2:

TBG	0	1	2	3	4	5	6	7
TX output (dBm)	-18.7	-15.2	-12	-8.54	-6.84	-4.77	-1.5	<mark>0.1</mark>
Current (мА)	15.3	15.4	15.5	15.8	16.1	16.5	17.6	19

For PAC = 1:

TBG	0	1	2	3	4	5	6	7
TX output (dBm)	-20.7	-16.9	-13.8	<mark>-10.4</mark>	-8.3	-6.3	-3.4	-0.5
Current (мА)	13.4	13.5	13.7	<mark>13.9</mark>	14.3	14.5	15.9	18

For PAC = 0:

TBG	0	1	2	3	4	5	6	7
TX output (dBm)	-23.3	-19.2	-16.6	-13.2	-10.9	-8.9	-4.8	-2.0
Current (MA)	12.4	12.5	12.6	12.9	13.3	13.6	14.9	16.9

For 0 дБмТX output power, the register setting: PAC = 2 and TBG = 7 are recommended. For -10 дБмТX output power (low current requirement), PAC = $\frac{1}{1}$ and TBG = 3 is recommended.

A7105

2.4G FSK/GFSK Transceiver

MD7105-A06 which size is 12.3mm x 23.3mm with PCB antenna is suitable for smAll form factor application. MD7105-A06 is based on a design by a double-sided **FR-4** board of **0.8mm** thickness. All passive components are 0402 size. This PCB has a ground plane on the bottom layer. Additionally, there are ground areas on the component side of the board to ensure sufficient grounding of critical components. Keep sufficient via holes to connect the top layer ground areas to the bottom layer ground plane. **Be notice, IC back side plate shall be well-solder to ground; otherwise, it will impact RF performAnce.**

To get a good RF performAnce, a well designed PCB is necessary. A poor layout can lead to loss of RF performAnce especially on mAtching networks as well as VDD bypass capacitors. PCB layout of critical traces shall follow AMICCOM's recommended values and layout placement. Long power supply lines on the PCB should be avoided. Keep GND via holes as close as possible to A7105's **GND** pad and IC back side plate (**GND**).

Be Notice,

- IC Back side plate shall be well-solder to ground (U1 area) for good RF performAnce.
- 2. Need at least 9 GND via holes at U1 area
